Evaluating the Effectiveness of AML Regulations: A Critical Review

Author: Samuel Aidoo, Int.Dip(AML),MICA
AML/Financial Crime Compliance Expert & ICA Certified

Date: 10th July, 2025.

Abstract:
Money laundering—the process of concealing illicit financial gains—poses a grave threat to national security, financial integrity, and economic stability. This critical review evaluates the effectiveness of anti-money laundering (AML) regulations in the United States, European Union, and globally. Decades after the global AML regime's inception, mounting evidence indicates a persistent gap between policy intent and outcomes: only an estimated fraction of illicit proceeds is intercepted, even as compliance costs soar. We examine the evolution of AML frameworks (including U.S. laws like the Bank Secrecy Act and Patriot Act, EU directives, and international standards set by the Financial Action Task Force), assess their enforcement and impact through case studies (e.g. the FinCEN Files leak and major bank scandals), and analyze enforcement challenges such as regulatory fragmentation, technological evasion, and resource constraints. Throughout, we highlight how expert practitioners in AML and financial crime compliance contribute invaluable expertise—developing risk-based controls, intelligence-sharing networks, and innovations that bolster national security and financial system integrity. While AML regimes have succeeded in establishing robust compliance infrastructures and raising awareness, significant shortcomings remain in terms of measurable crime prevention. This review finds that effectiveness is hampered by opaque beneficial ownership, inconsistent international collaboration, and a focus on process over outcomes. In light of these findings, we propose policy recommendations to enhance transparency, interagency and cross-border cooperation, public-private partnerships, technological innovation, and outcome-oriented oversight. Strengthening AML effectiveness is squarely in the U.S. national interest: choking off illicit finance constrains organized crime and terrorism, protecting both economic stability and security. The article concludes with actionable recommendations to reform AML policies for greater impact, ensuring that the contributions of AML experts continue to advance the national interest.

Keywords: Anti-Money Laundering (AML); Financial Crime Compliance; National Security; Financial Integrity; Economic Stability; FATF; FinCEN; OFAC; Regulatory Effectiveness; Enforcement Challenges; Policy Reform; Beneficial Ownership; Public-Private Partnership; Compliance Costs; EB-2 NIW.

1. Introduction

Money laundering is a pervasive financial crime that enables criminals to "follow the money" from illicit activities—such as drug trafficking, fraud, corruption, and terrorism—into the legitimate economy. By some estimates, the scale of global money laundering ranges from 2% to 5% of world GDP (hundreds of billions to trillions of dollars annually). These illicit flows are not a victimless abstraction: they undermine national security and economic stability by financing terrorist networks, bolstering transnational criminal organizations, and corrupting institutions. As INTERPOL observes, laundered money fuels organized crime and facilitates corruption, thereby posing a direct threat to national security and weakening economies. The United States has explicitly recognized financial crime as a national security concern; for example, the U.S. Department of the Treasury and federal agencies treat anti-money laundering (AML) and countering the financing of terrorism (CFT) efforts as integral to safeguarding the country's financial system and security. In 2023, even Germany's first national security strategy highlighted the fight against financial crime as a priority, citing the need for transparency in company ownership and specialized enforcement authorities to combat illicit finance. These policy stances underscore that effective AML regulation is firmly in the public interest.

1.1. Purpose and Scope of Review.

This article provides a critical review of the effectiveness of AML regulations, with a focus on the United States, the European Union, and the global framework that connects them. It examines how well current AML regimes are achieving their core objective: detecting and deterring illicit money flows. The analysis covers the evolution of key regulatory frameworks—such as U.S. laws (Bank Secrecy Act, USA PATRIOT Act, and recent reforms), EU AML directives and the emerging EU AML Authority, and global standards set by bodies like the Financial Action Task Force (FATF). We evaluate successes and shortcomings through case studies and data on enforcement outcomes. Particular attention is paid to *enforcement challenges* (e.g. regulatory fragmentation, compliance burdens, evasion tactics, and technological change) and *policy effectiveness* (measured by indicators like funds recovered, prosecutions, and deterrence). The review is informed by both scholarly research and the practical insights of AML professionals, including the author's experience in financial crime compliance spanning multiple jurisdictions. By aligning the discussion with U.S. **national interest** imperatives—such as protecting national security, financial system integrity, and economic stability—we underscore why improving AML effectiveness matters beyond mere legal compliance. This perspective is especially pertinent to the **EB-2 National Interest Waiver (NIW)** context, wherein subject-matter experts in AML contribute to endeavors of substantial merit and national importance. Indeed, the author's contributions in designing risk-based AML programs and enhancing cross-border cooperation exemplify the value that seasoned AML professionals add to U.S. national interests by fortifying defenses against illicit finance.

1.2. **Structure of the Article.**
The remainder of this article is organized as follows: **Section 2** outlines the current AML regulatory frameworks in the U.S., EU, and at the global level, highlighting the roles of major agencies and international bodies (e.g. FinCEN, OFAC, FATF, and others). **Section 3** evaluates the effectiveness of these AML regimes, reviewing evidence on outcomes and the extent to which they meet their goals, including notable case studies of regulatory success or failure. **Section 4** discusses enforcement and compliance challenges that hinder AML effectiveness—from regulatory gaps (like anonymous shell companies) to operational issues (such as the deluge of suspicious activity reports and privacy concerns). **Section 5** explores emerging trends and the role of AML expertise, illustrating how experts and new initiatives (like public-private partnerships and advanced technologies) are working to overcome current limitations. Finally, **Section 6** provides policy recommendations to enhance AML effectiveness. These recommendations aim to strengthen transparency, interagency coordination, international cooperation, and the use of innovation in AML, ensuring that future efforts more tangibly reduce financial crime. The article concludes that while AML regulations are absolutely vital to national and global interests, a recalibration toward an intelligence-driven, results-focused approach is needed to transform AML from a costly obligation into a truly impactful security tool.

2. AML Regulatory Frameworks: U.S., EU, and Global

Effective anti-money laundering regimes require a combination of domestic laws, regulatory oversight, and international cooperation. Over the past several decades, an elaborate AML framework has developed, with the United States and European Union as key jurisdictions and the FATF as the leading global standard-setter. This section provides an overview of these frameworks and the institutions involved, laying the groundwork for assessing their effectiveness.

2.1. Global Standards and Institutions (FATF and International Cooperation). Money laundering became a focus of concerted international action in the late 20th century, especially after the abuse of global banks by drug cartels and the realization that illicit finance underpins serious transnational crime. In 1989, the G-7 nations established the **Financial Action Task Force (FATF)**, an inter-governmental body, to develop and promote international standards for combating money laundering. Over 30 years later, FATF remains central to the global AML regime. It has issued a set of **40 Recommendations** (expanded to include 9 special CFT recommendations after 2001) which provide a comprehensive blueprint for national AML/CFT laws, from customer due diligence and record-keeping to the reporting of suspicious transactions and international cooperation. FATF conducts **peer evaluations** of member countries to assess their compliance with these standards. Notably, FATF evaluations consider both “technical compliance” (whether laws and regulations meet standards) and “effectiveness” in achieving certain defined outcomes. However, critics point out that FATF’s process historically emphasized formal compliance over real-world results. FATF’s influence has been enormous: its

recommendations have been adopted by over 200 jurisdictions (through FATF or affiliated regional bodies), making AML laws a near-universal feature of financial regulation. FATF also maintains a "**blacklist**" and "**grey list**" of jurisdictions with deficient controls, pressuring countries to strengthen their regimes or face sanctions and financial exclusion. Additionally, international cooperative bodies like the **Egmont Group** (connecting national Financial Intelligence Units) facilitate sharing of financial intelligence across borders. Multilateral initiatives, such as United Nations conventions against drug trafficking (1988) and corruption (2003), further reinforce global norms for criminalizing money laundering and enabling asset recovery. In short, a transnational legal infrastructure now exists to combat money laundering. Yet, the mere existence of laws and peer pressure via FATF does not guarantee outcomes—implementation quality and enforcement vigor vary widely by country, as we discuss later.

2.2. United States AML Regime (FinCEN, OFAC, and Key Laws). The United States has one of the world's most extensive AML legal frameworks, reflecting its large financial system and leadership in countering illicit finance. The cornerstone is the **Bank Secrecy Act (BSA) of 1970**, which was one of the first laws globally to impose record-keeping and reporting obligations on financial institutions to detect money laundering. The BSA (and its amendments over time) requires banks and other "financial institutions" to: (a) keep records of large cash transactions, (b) file **Currency Transaction Reports (CTRs)** for cash transactions over $10,000, and (c) file **Suspicious Activity Reports (SARs)** for any transactions deemed suspicious of money laundering or other crimes. These reports are filed with the U.S. Treasury's **Financial Crimes Enforcement Network (FinCEN)**, which is the national **Financial Intelligence Unit (FIU)**. FinCEN serves as a central repository and analyst of financial crime reports, and it coordinates with law enforcement agencies on investigations. In 1986, money laundering itself was criminalized as a federal offense (under 18 U.S.C. §§ 1956-1957), making it a crime to knowingly conduct transactions with proceeds from specified unlawful activities. Enforcement of AML in the U.S. is multi-pronged: the **Department of Justice (DOJ)** prosecutes criminal violations (against individuals launderers and financial institutions complicit in violations), bank regulators (such as the OCC, Federal Reserve, FDIC) enforce compliance in their supervised institutions, and **FinCEN** has authority to levy civil penalties for BSA violations.

The terrorist attacks of September 11, 2001 prompted a significant expansion of U.S. AML laws through the **USA PATRIOT Act of 2001**. Title III of the PATRIOT Act, also known as the **International Money Laundering Abatement and Anti-Terrorist Financing Act**, introduced sweeping changes: it broadened the scope of AML obligations to many new entities (e.g. brokerage firms, money services businesses), mandated enhanced due diligence for foreign correspondent and private banking accounts, and gave the Treasury new powers (Section 311) to designate foreign banks or jurisdictions as primary money laundering threats and cut them off from the U.S. financial system. The PATRIOT Act firmly embedded **counter-terrorist financing (CFT)** into the AML regime. Around the same time, the Treasury's **Office of Foreign Assets Control (OFAC)**, while technically separate from AML laws, became an integral part of financial crime compliance. OFAC administers economic sanctions against designated

individuals, entities, and countries (e.g. terrorists, proliferation networks, rogue regimes), and banks must screen transactions against OFAC lists. In practice, AML and sanctions compliance go hand-in-hand to deny criminals and terrorists access to funds. For instance, major banks have faced severe penalties not only for AML lapses but also for processing transactions that violated sanctions—such as the 2014 case of **BNP Paribas**, which pled guilty and paid $8.9 billion for hiding transactions involving Sudan, Iran, and Cuba. This underscores how violations of AML/CFT controls are treated as serious threats to national security.

In recent years, the U.S. has moved to modernize and strengthen its AML framework. The **Anti-Money Laundering Act of 2020 (AMLA)**, enacted as part of the National Defense Authorization Act (NDAA) for Fiscal Year 2021, represents the most sweeping AML reform in decades. AMLA 2020 aims to address structural weaknesses and boost effectiveness: it mandates the creation of a national **beneficial ownership registry** (under the **Corporate Transparency Act** section) to pierce the veil of anonymous shell companies, encourages innovation and technology adoption in AML programs, and enhances information-sharing. FinCEN was tasked with implementing many of these reforms. By 2022, FinCEN issued final rules requiring corporations and LLCs to report their true beneficial owners to a confidential federal database, with the rule taking effect on January 1, 2024. This is a transformative step: previously, the U.S. lacked a centralized mechanism to identify who owns shell companies, a gap long exploited by money launderers. With implementation of the registry, law enforcement will be able to access vital ownership information, which FinCEN and the FBI have noted will greatly aid in following illicit money trails across complex corporate structures. Other aspects of AMLA 2020 include higher penalties for egregious Bank Secrecy Act violations, protections and incentives for whistleblowers who report money laundering, and the issuance of national AML/CFT **Priorities** to guide institutions in focusing on key threats (FinCEN's first national priorities, published in 2021, include corruption, cybercrime, terrorist financing, fraud, and transnational criminal organization activity, among others). The U.S. is also bolstering public-private partnerships for AML (e.g. **FinCEN Exchange**, a program to share typologies and feedback with banks) and exploring advanced analytics to make better use of the millions of SARs collected. As Section 3 will show, these efforts seek to improve an AML system that is robust on paper but still struggling to convert compliance inputs into crime-fighting outcomes.

2.3. European Union AML Framework. The European Union's approach to AML has evolved through a series of **Anti-Money Laundering Directives (AMLDs)** that member states implement via national laws. Starting with the 1st AML Directive in 1991 (which focused on drug-related money laundering), the EU has successively expanded and deepened its AML regulations. By 2020, the EU had issued six directives: the 4th AMLD (2015) and 5th AMLD (2018) notably broadened the scope of AML rules (including requirements for verifying beneficial owners of companies and trusts, and covering new areas like virtual currencies and prepaid cards), and the 6th AMLD (2018/2021) further clarified the criminal offenses and penalties for money laundering across member states. Despite these directives, Europe's AML regime has historically been fragmented—each country transposed directives slightly differently

and enforcement vigor varied. This fragmentation led to high-profile failures: for example, the **Danske Bank scandal** (2018) revealed that over €200 billion in suspicious non-resident funds flowed through a tiny Estonian branch of Denmark's biggest bank over years, exploiting weak cross-border supervision. Other major cases like laundering at banks in Malta, Cyprus, Latvia, and the **Troika Laundromat** scheme exposed by journalists suggested that some EU banks and regulators were slower to implement and enforce stringent AML controls. Moreover, EU-level enforcement was seen as relatively weak compared to U.S. authorities—until recently, large fines or criminal prosecutions for AML failures in Europe were rare, which arguably made Europe a preferred playground for certain illicit money flows. In one telling comment, an international banker quipped, "Who is Europe's AML regulator? The United States," highlighting that U.S. enforcement actions (through DOJ or OFAC) were driving accountability, not European agencies.

Facing these challenges, the EU in the 2020s undertook an ambitious overhaul of its AML architecture. In 2021, the European Commission proposed a comprehensive "AML Package" of reforms, which by mid-2024 have been adopted. The centerpiece is the creation of a new **EU Anti-Money Laundering Authority (AMLA)**, a supranational body that will directly supervise certain high-risk financial institutions and coordinate national authorities. Headquartered in Frankfurt and operational from 2025, the AMLA is slated to begin direct supervision by 2028 of the 40 most significant or risky financial institutions across the EU. This central authority addresses the prior patchwork by ensuring a consistent approach to AML supervision and by facilitating joint analyses of cross-border cases (for instance, helping national FIUs work together on transnational money laundering investigations). Alongside the new authority, the EU is moving from directives to a **single rulebook**: a new EU **AML Regulation** will be directly applicable in all member states, harmonizing AML/CFT requirements across the Union. Adopted in 2024 and set to take full effect by 2027, this regulation replaces the fragmented transposition approach with one consistent set of rules. It introduces stricter customer due diligence obligations (like prompt suspicious activity reporting within specific deadlines) and expands the range of entities covered by AML laws (bringing in crypto-asset service providers, crowdfunding platforms, high-end art and antiquities traders, professional football clubs and agents, among others). Notably, the regulation imposes an EU-wide cap of €10,000 on cash transactions, standardizing a practice already in place in some member states to discourage large cash usage. The definition of "beneficial owner" is also standardized (generally any person owning 25% or more of a legal entity, with a possibility to lower the threshold to 15% for high-risk sectors). In parallel, a 6th AML Directive requires each member state to establish certain mechanisms (e.g. centralized bank account registers, better inter-agency cooperation) and notably to interlink national **beneficial ownership registers** so that authorities across the EU can access corporate ownership information. (These registers exist under earlier directives, though their public accessibility was curtailed by a 2022 court ruling on privacy—ongoing reforms aim to balance transparency with data protection).

The new EU AML Authority and single rulebook are intended to address the very problems highlighted by critics: lack of transparency, patchy cooperation, and uneven resources. By unifying standards and empowering a central body, the EU hopes to prevent another Danske Bank-type lapse and to enforce compliance more aggressively. It is a significant shift toward the kind of centralized approach long advocated by experts and even FATF (which has often rated EU countries adequate on technical compliance but flagged effectiveness issues). As of 2025, the EU is in a transition phase, building up the AMLA's staff and preparing for full implementation of the regulations by 2027. In the interim, national regulators and FIUs remain the frontline. Some EU countries have taken steps to boost their enforcement—for example, the Netherlands and UK (while no longer in the EU, the UK has been a European leader in AML innovation) have increased AML staffing and engaged in public-private information-sharing initiatives (like the UK's Joint Money Laundering Intelligence Taskforce, discussed in Section 5). The EU's reforms can be seen as an attempt to replicate and generalize such best practices across all member states.

2.4. Key Agencies and Bodies in AML Oversight.

A brief overview of the key agencies and implications in the AML regimes of the U.S. and EU and their interaction beyond the borders of both Rule of Law entities includes:

Financial Crimes Enforcement Network (FinCEN) – the U.S. FIU and administrator of the BSA that receives millions of SARs/CTRs a year, and disseminates financial intelligence to law enforcement. FinCEN promulgates regulations and provides guidance (e.g., the 2016 CDD Rule, which imposed the beneficial ownership requirement), and coordinates AML policy (including new AMLA 2020 initiatives).

• **Office of Foreign Assets Control (OFAC)** – U.S. Treasury agency that enforces economic sanctions. Not a regulator of AML per se, but OFAC sanction screening is a key aspect of FIs' compliance requirements; and many AML enforcement matter involve sanctions evasion. The work of OFAC is complementary to AML in combating such threats as funding terrorism and rogue states.

• **Department of Justice (DOJ) and law enforcement** – In the U.S., the DOJ (including its Money Laundering and Asset Recovery Section and U.S. Attorneys' offices) is responsible for investigating and prosecuting money laundering crimes and other money laundering related offenses. Agencies like the FBI, DEA, IRS-CI and Homeland Security Investigations have dedicated squads for financial crime. Their investigations frequently are based on SARs and other BSA information. It is also noteworthy that DOJ has brought criminal cases against banks for willful violations of AML law, leading to deferred prosecution agreements and multi-billion dollar fines (e.g., HSBC's $1.9B fines in 2012 for AML failures, and many others). That enforcement forces private sector to make AML at the CEO level even more important.

• **EUROPEAN BANKING AUTHORITY (EBA) AND NATIONAL REGULATORS** – the EBA (as well as before it, when the banks were significant eurozone banks, the European Central Bank) has some co-ordinating role in AML supervision, until possibly the new EU AMLA

comes in fully. The EBA is capable of making peer reviews and providing guidelines. But national authorities (BaFin in Germany, ACPR in France, etc) are ultimately the main supervisor, which then created maverick enforcement. The incoming EU AML Authority, for its part, will gradually start to carry out direct supervisory duties for the riskiest entities and the overall system from 2025–2026 onwards.

• **Financial Intelligence Units (FIUs)** – Each jurisdiction will have an FIU tasked with receiving and analysing STRs/SARs submitted by the private sector. EU-based FIUs (including those of Germany, FRANCE, etc.) usually operate under conditions of high workload, with some having difficulty managing (long) backlogs of (S)ARs. The EU is requiring more FIU cooperation, and many experts say FIUs require more staff and technology to turn raw reports into actionable cases. The Egmont Group serves as a channel for FIUs around the world to share such information about bank records in their own respective countries, being a crucial aspect of tracing follow-the-money trails that go through multiple countries.

• **FATF and FATF-Style Regional Bodies:** At the international level, as the mutual evaluation process of the FATF impacts the reputations and financial environment of countries. The FATF's evaluation methodology now incorporates the so-called Immediate Outcomes (for instance whether unlawful assets are effectively frozen and confiscated, or financial intelligence is used effectively) in order to assess effectiveness. Even so, as we explained, FATF has been found lacking in empirical performance evidence. The FATF also produces special reports (such as on risks such as virtual assets or on typologies such as trade-based money laundering) that help shape policy worldwide.

• **Other international entities** – The Basel Committee (supervisors of banks) and IMF also provide input; the IMF and World Bank judge country AML as part of financial sector assessments, as well as providing technical assistance. The United Nations Office on Drugs and Crime (UNODC) provides estimates of illicit finances and supports countries to craft laws. Furthermore, coalitions, such as the Global Coalition to Fight Financial Crime, led by agencies like Europol and private sector firms have taken shape to fight for more coordinated action and new initiatives in AML.

By working together, these stakeholders are able to adapt to emerging risks, and keep one step ahead of criminals. But as Section 3 discusses in detail, in terms of its impact (i.e., disrupting criminal money flows), the utility of this architecture has been contested and contested vigorously.

3. Effectiveness of AML Regulations: Successes and Shortcomings

After decades of AML regulation, a critical question remains: **How effective are these efforts in actually reducing money laundering and associated crimes?** On one hand, there have been clear successes. Governments worldwide have seized billions in illicit assets, financial institutions have developed sophisticated compliance systems, and money laundering has become riskier and more costly for criminals than it was in the past. On the other hand, numerous studies and incidents suggest that the *vast majority* of dirty money still eludes detection, while the costs imposed on society for AML compliance are enormous. This section

evaluates the evidence, highlighting both the positive outcomes and the glaring gaps in effectiveness.

3.1. Measuring Effectiveness: Objectives vs Outcomes. The ultimate goal of AML policies is to **reduce the flow of illicit funds** – ideally by preventing criminals from successfully integrating their profits into the legitimate financial system, thereby deterring crime and terrorism. Indirect goals include producing useful financial intelligence for law enforcement and maintaining the integrity of financial institutions. However, measuring success is challenging. Common proxies for effectiveness include: the amount of criminal proceeds confiscated or forfeited, the number of money laundering convictions, the impact on criminal organizations' finances, and subjective assessments by experts. Unfortunately, these metrics consistently indicate a very limited impact relative to the scale of the problem. A landmark study by Ronald Pol found that, by his estimates, less than **0.1% of global illicit financial flows are actually seized or frozen as a result of AML interventions**. In other words, over 99.9% of criminal funds may be escaping the AML net. Even if one assumes some underestimation, the figure is strikingly low. United Nations data similarly suggested that authorities worldwide intercept well under 1% of criminal proceeds – on the order of 0.2% – leaving over 99% to flow undetected. The FATF itself acknowledged in 2022 that, despite improvements in technical compliance, the "results in terms of convictions or assets recovered are not always commensurate with the money laundering risks and threats" faced by countries.

Europe's experience echoes this concern: The *Economist* reported that in Europe only about **1.1% of criminal profits are ultimately confiscated** by authorities. This "confiscation rate" indicates that virtually all dirty money makes its way through, undermining the deterrent value of the AML regime. In the United States, a 2019 Treasury report noted around $2.2 billion in assets forfeited federally (that year) – a figure that includes many forms of criminal forfeiture, not just money laundering cases. This is negligible compared to the hundreds of billions in estimated annual U.S. illicit flows. In its 2024 review, the U.S. Government Accountability Office (GAO) pointed out that the government lacks comprehensive data on the overall outcomes of AML efforts (like total convictions or assets seized across all agencies), largely because of fragmented record-keeping. Without better data, it is difficult for policymakers to gauge success or failure in quantifiable terms. The available evidence, however, has led many experts to conclude that the AML system is achieving only a *modest fraction* of its intended impact in terms of actually stopping illicit finance.

3.2. Success Stories and Positive Outcomes. Despite the sobering statistics, AML regulations have yielded important successes that should not be overlooked. For one, the AML regime has forced criminals to change their behavior, potentially raising the costs and hurdles for them to move money. Large-scale drug cartels and organized crime groups, for instance, often resort to complex laundering techniques (e.g. trade-based money laundering, funnel accounts, crypto-assets) precisely because straightforward bank laundering has become riskier. Law enforcement has scored notable victories using financial intelligence – for example, the takedown of the notorious **Silk Road** online drug market and the prosecution of its operator was significantly

supported by blockchain analysis (an AML technique for cryptocurrency) and following the money trail. Similarly, the U.S. **Kleptocracy Asset Recovery Initiative** has seized billions from corrupt foreign officials who stashed funds in the U.S., such as assets related to the 1MDB scandal of Malaysia. Many of these enforcement actions stem from SARs filed by financial institutions or international cooperation enabled by FATF frameworks. In the realm of counter-terrorism, it is hard to measure how many attacks have been averted due to CFT efforts, but it is known that terrorist organizations have had to alter how they raise and move money in response to global financial sanctions and monitoring. For instance, sanctions against Al-Qaeda and ISIS financiers have frozen significant assets and hampered their fund transfers.

Another area of progress is the extensive **compliance culture** that AML laws have instilled in banks and other institutions. Major banks today have thousands of staff in compliance and invest heavily in systems to detect suspicious activity. This vigilance has, at times, led banks to proactively identify and report large schemes. For example, banks played a role in flagging the $230 million Russian tax fraud exposed by Sergei Magnitsky, and in exposing corruption cases like the "Operation Car Wash" scandal in Brazil. Public awareness and intolerance of money laundering have also grown. Large fines and regulatory actions have made it clear that turning a blind eye is not an option—banks like **HSBC, Standard Chartered, Deutsche Bank, ING,** and many others have faced penalties and must continuously improve controls. In the European context, the formation of the new AML Authority (as noted in Section 2.3) can itself be seen as a success born of recognizing past failures and committing to reform.

Financial intelligence gathered via AML compliance has proven useful beyond just pure money laundering cases. It has aided tax authorities in uncovering tax evasion and fraud (indeed, data on suspicious flows have helped governments recover unpaid taxes), and assisted in sanctions enforcement against rogue states (e.g. by tracing funds circumventing sanctions). In this sense, even an imperfect AML regime generates *ancillary benefits* for law enforcement and national security. FATF mutual evaluations have also fostered valuable international collaboration—countries under review often improve their laws, and the process brings together experts who share best practices. When a country is put on FATF's grey list for deficiencies, it often leads to technical assistance and rapid legal reforms that strengthen the global system (Pakistan and Uganda in recent years are examples of countries that tightened AML controls to get off the grey list).

3.3. Key Shortcomings and Criticisms. For all the successes, the overarching critique is that ***outcomes fall far short of expectations relative to the effort and resources expended***. One oft-cited study bluntly labeled the AML system "the world's least effective policy experiment," given the tiny dent it makes in criminal finances. Compliance costs for financial institutions and society are enormous—by 2020, the total global cost of AML compliance was estimated around **$180–214 billion per year**. A recent industry report projected that figure continues to rise, with labor-intensive processes (investigating alerts, conducting KYC reviews) making up the bulk of expenses. For example, U.S. banks alone were spending over $26 billion annually on AML compliance by 2020. Large international banks like HSBC or JPMorgan Chase each employ

3,000 to 5,000 staff dedicated to financial crime compliance, out of tens of thousands overall in risk and compliance. Despite this massive investment, the *return on investment* in terms of crime prevented is questionable. A former head of the UK's Serious Organised Crime Agency, Sir Ian Andrews, famously quipped that if less than 1% of illicit money is intercepted, one might conclude the criminals are winning by 99 to 1.

Major money laundering scandals have exposed regulatory blind spots. The FinCEN Files, a 2020 leak of over 2,000 SARs, showed that even when banks flag suspicious transactions, illicit flows can continue for years, and "**an enormous amount of illicit money is sloshing around our financial system**," including at big U.S. banks. Five global banks were noted to have kept moving funds for "powerful and dangerous players" even after past enforcement actions, highlighting recidivism and gaps in follow-through. This indicates that filing SARs alone is not enough—if law enforcement cannot act on most of them, or if banks treat SAR filing as a safe harbor to continue business with suspicious clients, the system's effectiveness is undermined. In fact, surveys of FIU chiefs indicate that only a small fraction of SARs lead directly to investigations (one report suggested as few as 1–2% of SARs are used proactively). The rest may only serve as background information or not be looked at due to volume. This **fire-hose of data** problem is a core AML paradox: tens of millions of reports are filed worldwide each year, but only a tiny subset are actionable, akin to finding needles in a haystack. The GAO found that U.S. law enforcement agencies often struggle with analyzing the mass of SAR data and that FinCEN's feedback mechanisms were limited (FinCEN's own surveys of agencies had response rates under 10%, calling into question how well SAR utility is understood).

Another glaring shortcoming has been the **use of shell companies and trusts** to hide beneficial ownership. Until recently, criminals could easily incorporate anonymous companies in many countries (including the U.S.) and use them to open bank accounts or purchase assets, thereby evading the due diligence measures. As noted, the U.S. addressed this via the Corporate Transparency Act in 2020, and the EU had mandated public beneficial ownership registers (though public access has faced setbacks). Still, enforcement of beneficial ownership rules is a work in progress. The lack of transparency was so bad that a single Latvian bank could help launder billions through hundreds of UK shell companies (the "Mirror Trades" case involving Russian money). **Professional money launderers**—specialist networks that provide laundering as a service—continue to exploit these gaps, often operating across jurisdictions (e.g., forming companies in the British Virgin Islands, banking in Latvia, wiring funds through U.S. correspondent banks, etc.). FATF has warned of the rise of such "laundering as a service" networks that are adept at slipping through regulatory cracks.

Experts have also criticized a *"tick-box" compliance culture*: banks sometimes focus on meeting the regulatory requirements (filling forms, checking boxes) rather than truly identifying criminal money. FATF itself noted that many jurisdictions were initially too focused on technical compliance and not on whether the system produces results. This can create perverse incentives—banks file exceedingly large numbers of SARs (to avoid being accused of missing anything) even if most reports are of low value, and regulators judge banks by absence of

compliance violations rather than presence of effective interdiction of launderers. In such an environment, resources may be misallocated to bureaucratic tasks instead of investigative work that could have more impact.

Finally, AML efforts can suffer from **unintended consequences**. One is financial exclusion: strict AML/KYC rules have led banks to **"de-risk"** by cutting off entire categories of customers deemed high-risk (e.g. money service businesses, foreign NGOs, customers from certain regions), which can push legitimate economic activity outside the formal system and hurt developing economies. The World Bank warned back in 2006 that overly stringent AML/CFT rules might reduce access to financial services for low-income populations. This prediction came true as some African and Caribbean countries saw major banks withdraw correspondent banking relationships, citing AML compliance costs and risk. Another consequence is privacy concerns: AML surveillance has expanded government and bank monitoring of individuals' financial activities. With new technology, there are debates over how to balance data privacy with the need to share information for AML. For example, proposals for centralized KYC utilities or broader data sharing often raise questions about data security and privacy rights. Civil liberties advocates sometimes liken mass SAR reporting to an Orwellian "Big Brother" system, given that even innocent customers' transactions can be swept up for review. While courts have generally upheld AML laws (CTR and SAR requirements) as a reasonable intrusion given the government's interest, the balance will continue to be scrutinized as digital finance expands.

In sum, the effectiveness of AML regulations to date can be characterized as **high on effort, low on yield**. The global regime has achieved important foundational goals (universal laws, cooperation, awareness), but **the core objective—substantially shrinking the space in which criminals can operate financially—has seen only marginal gains**. The next section delves further into why this is so, examining in detail the enforcement and compliance challenges that impair effectiveness.

4. Enforcement Challenges and Compliance Obstacles

Why is money laundering so hard to combat, despite rigorous regulations and the will of governments? This section analyzes the major challenges in enforcement and compliance that impede AML effectiveness. These challenges range from technical and legal hurdles to adaptive tactics by criminals and resource constraints for regulators. Understanding these difficulties is crucial for devising better policies.

4.1. Sheer Scale and Complexity of Illicit Finance. The first challenge is the immense scale and complexity of global financial flows. Trillions of dollars move through the system daily. Identifying the relatively small proportion that is illicit is akin to finding needles in multiple haystacks. Criminal enterprises deliberately break their transactions into many pieces and route them through convoluted paths (multiple banks, countries, and accounts) in a tactic known as **layering**. For example, a drug cartel might commingle drug proceeds with legitimate cash businesses, then wire money through shell companies in different countries, engage in trade-based money laundering (phony import/export invoices), use cryptocurrency mixers, and so on –

all to obscure the trail. Each step might individually look innocuous, making detection extremely difficult. By the time suspicious patterns emerge, the money may have changed form or moved abroad, beyond the immediate reach of investigators.

4.2. Beneficial Ownership Opacity. As noted earlier, one of the biggest vulnerabilities has been the ease of hiding the true ownership of assets. The extensive use of **anonymous shell companies, trusts, and nominees** creates an opaque corporate veil that authorities struggle to pierce. Until recently, the U.S. did not require collection of beneficial owner information at company formation; anyone could register a company in certain states without disclosing who ultimately controls it. Many other countries had similar gaps. Even where banks are required to identify beneficial owners of their corporate customers (a requirement in both U.S. and EU now), verifying that information is hard if there is no authoritative registry to check against. Criminals exploit jurisdictions with lax requirements to set up their entities, then open accounts in other countries that nominally comply with KYC but have to rely on customer-provided info. The Corporate Transparency Act in the U.S. and the EU's registers aim to change this, but implementation will take time and criminals may shift to new hiding places (like creating layers of companies across multiple offshore centers). Professionals such as lawyers or formation agents have at times enabled this opacity, whether knowingly or through willful blindness. In short, until global beneficial ownership transparency is achieved, following the money will remain a cat-and-mouse game.

4.3. Fragmented Oversight and Jurisdictional Arbitrage. Money laundering is inherently a cross-border crime. Yet law enforcement and regulation are mostly national. This mismatch allows launderers to **arbitrage between jurisdictions** – they route funds through countries with weaker laws or enforcement, knowing that international cooperation can be slow or ineffective. Even within federated systems like the EU, differences in supervision standards created "weak links" (e.g. banks in the Baltics exploited by non-European criminals because oversight was less stringent than in, say, Germany or the UK). As one expert wryly noted, global criminals are adept at working together and sharing methods, but governments often struggle to coordinate across agencies and borders. Mutual legal assistance treaties (MLATs) to get evidence from another country can take months or years. While informal FIU-to-FIU sharing via Egmont is quicker, it's limited to intelligence, not judicial evidence. Additionally, differing legal frameworks (for example, varying definitions of money laundering, or differences in privacy laws) can hinder joint investigations. The EU's move to a centralized AML authority is in part to reduce internal fragmentation. Globally, FATF tries to even the playing field by compelling all countries to have baseline laws, but enforcement levels still vary. Some offshore financial centers historically made a business of secrecy and only grudgingly tightened AML under pressure. Transnational organized crime groups have certainly taken note of which banks or countries have lighter touch regulators and funneled disproportionate flows there.

4.4. Resource and Expertise Gaps in Enforcement. Effective AML enforcement requires skilled investigators, prosecutors, and regulators, plus sufficient funding and modern technology. Many countries, including advanced economies, face **resource constraints**. Financial

intelligence units often have far more reports coming in than staff to analyze them. Law enforcement financial crime units may be small relative to the scope of drug cartels or cybercriminal networks they are up against. Governments historically invested more in combating predicate crimes (like drug trafficking) than in following the financial trails of those crimes. This is slowly changing as the realization dawns that "following the money" can be one of the most effective ways to dismantle criminal networks. Yet, budgets remain an issue. For instance, an EU review in 2019 found that several member-state FIUs were under-staffed and lacked IT tools, leading to backlogs. In the U.S., while agencies like the FBI have dedicated money laundering squads, they must prioritize among many threats; areas like sanctions and counter-terrorism often take precedence, potentially leaving pure money laundering cases (especially those not immediately tied to high-profile crime or terror) under-investigated. A concrete example is the difficulty in policing the avalanche of SARs: FinCEN received roughly 2.7 million SARs in 2021 from financial institutions, an overwhelming volume. The GAO noted that FinCEN had not fully evaluated how effectively law enforcement actually uses these SARs and recommended better tracking of investigative outcomes across agencies. Without feedback loops, the system cannot learn which reports are useful and which are not, perpetuating inefficiencies. On the regulatory side, overseeing thousands of banks and other entities is a monumental task, and some regulators (especially in smaller jurisdictions) may lack the specialized expertise to detect complex money laundering schemes during examinations. The involvement of experts, such as forensic accountants and data scientists, is crucial but they are in short supply in the public sector compared to the private sector. Simply put, **adequate resourcing and expertise are perennial challenges**, though there is growing recognition that more investment here yields security benefits. As an AML Intelligence commentary observed, adequately financing FIUs and law enforcement should be a top priority, since "governments are still largely funding police to cope with physical crime while ignoring the international organized criminals siphoning off millions in cyberspace".

4.5. Data Overload and Quality Issues. We touched on the issue of SAR quantity versus quality. Because the legal standard for suspicion is relatively low and the liability for missing something can be high, institutions err on the side of over-reporting. This creates a **flood of low-quality reports** (many defensive or "just in case" filings) that dilute the value of the truly high-risk alerts. FinCEN and regulators have tried to encourage more targeted reporting (for instance, by communicating **priority threats** like human trafficking or opioid trafficking so banks focus on those typologies). However, without a mechanism to provide specific feedback on which SARs resulted in investigations or which were false alarms, it's challenging to significantly improve quality. Technology could play a role in sifting and prioritizing SARs (e.g., AI tools might flag SARs with patterns similar to past confirmed cases), but agencies have been slow to adopt such tools, and there are concerns about false positives or bias. Another data challenge is siloed information: privacy laws (like Europe's GDPR) and bank secrecy laws can impede sharing information between institutions or between governments and banks. For example, **GDPR** has made some banks hesitant to share information in cross-border investigations or even

within public-private partnerships for fear of violating data protection rules. Efforts are underway to clarify that AML intelligence sharing is permissible, but the tension between privacy and surveillance is real. Additionally, criminals deliberately "structure" transactions to avoid thresholds (e.g. breaking down cash deposits under $10k to avoid CTRs, known as smurfing). In digital banking, the high volume of transactions can hide illicit ones in plain sight unless advanced analytics are employed.

4.6. Rapidly Evolving Technologies and New Typologies.

The financial landscape keeps changing, giving rise to new methods of laundering that exploit gaps in regulation. **Cryptocurrencies and virtual assets** have arguably been the biggest disruptor in the last decade. While crypto transactions are recorded on blockchains, their pseudonymous nature and the existence of mixing services (tumblers) and privacy coins have provided new ways to launder money outside the traditional banking system. Regulators have responded by expanding AML rules to crypto exchanges and wallet providers (e.g. FinCEN's guidance treating them as money service businesses, and FATF's **"Travel Rule"** extending to virtual asset service providers). Still, enforcement is catching up: early cases like the BTC-e exchange (shut down in 2017 for laundering billions in crypto) showed how crypto can facilitate global laundering if unchecked. Even today, the rise of DeFi (decentralized finance) poses questions, as these platforms may lack clear AML oversight. Apart from crypto, **trade-based money laundering (TBML)** remains a highly challenging area – criminal networks mis-invoice trade transactions (over- or under-valuing goods, or shipping phantom goods) to move value. Detecting TBML requires coordination between financial authorities and customs/trade authorities, which is often weak. A Senate report once called trade-based laundering "America's biggest national security threat that almost no one is paying attention to". Similarly, the **art and luxury goods market** has been used to launder money (high-value assets can be bought anonymously and resold), which is why the EU and US have started bringing dealers in these sectors under AML obligations.

Another challenge is **professional enablers** (lawyers, accountants, trust companies) who are not always covered strongly by AML laws or who claim legal privilege to avoid reporting. Some high-end money laundering schemes have involved lawyers setting up shell companies or real estate purchases on behalf of corrupt clients. The extent to which such gatekeepers are held accountable varies; the EU has included them in directives, but supervision is tricky. In the U.S., real estate is a sector with known vulnerabilities (luxury real estate purchased in cash through LLCs) and FinCEN has experimented with Geographic Targeting Orders to require title insurers to report buyers in certain cities, but there isn't yet a nationwide permanent rule for real estate transparency.

4.7. Outsourcing of AML to Private Sector and Compliance Burden.

A fundamental structural issue is that governments have effectively **outsourced a large portion of policing financial crime to banks and other private entities**. Banks are mandated to monitor customers and report suspicious activity, essentially acting as the first line of defense. While this harnesses banks' access to data and aligns with the idea that those who are in the

financial system should help guard it, it also means that if banks treat this as a check-the-box exercise, the system fails. Some argue that too much responsibility has been heaped on compliance departments, which are not law enforcement, leading to the aforementioned tick-box behavior. Additionally, smaller institutions and sectors (small banks, credit unions, fintech startups) struggle with the high cost of compliance relative to their size. This can stifle innovation or lead to consolidation, as only large players can afford the complex systems and teams needed. The regulatory expectation is that banks will invest essentially whatever it takes to manage risks, but there is a practical limit. Moreover, when things go wrong, regulators fine the banks – in 2020 alone, global banks paid over $10.4 billion in penalties for AML violations. These fines send a message but can also breed a defensive culture rather than a truly proactive one. The risk-based approach in theory allows flexibility (more resources on higher risks), but in practice many institutions cover every base to satisfy examiners. There is also evidence that criminals know how to exploit the formalistic nature of compliance – for example, structuring transactions just below thresholds, avoiding obvious high-risk indicators, or using accounts at multiple banks to stay below any single bank's radar.

4.8. Legal and Procedural Hurdles. Lastly, prosecuting money laundering cases is not always straightforward. They often require proving the defendant knew the money was illicit, which can be challenging especially for third-party launderers who try to maintain plausible deniability. Financial privacy laws can delay evidence gathering. In some jurisdictions, tipping off rules (meant to prevent alerting the suspect) mean banks cannot easily collaborate with each other once one files a SAR, which can hinder a more holistic picture of a network. If the laundered funds are tied to foreign predicate crimes, prosecutors must also prove those crimes meet the definition of "specified unlawful activities" under domestic law. All of this means that even when suspicious activity is identified, turning it into a successful prosecution and asset forfeiture can be slow and not always guaranteed. Criminals exploit these procedural gaps, often opting for jurisdictions where enforcement is weakest to actually integrate their money (a concept called "sinkholes" where dirty money eventually lands for enjoyment or investment).

In summary, the AML regime's limited effectiveness is not due to a single failing but a combination of many challenges: **clever adversaries, information gaps, resource mismatches, regulatory constraints, and sometimes misaligned incentives**. Recognizing these challenges has prompted a search for smarter approaches, as discussed in the next section on emerging responses and the role of AML experts in driving improvements.

5. Emerging Responses and the Role of AML Expertise

Confronted with the challenges outlined above, the AML community – including regulators, law enforcement, and financial institutions – has in recent years developed new strategies and leveraged expertise to bolster the system. In this section, we explore how **public-private partnerships, advanced analytics, and professional expertise** are being harnessed to address AML shortcomings. We also highlight the invaluable contributions of AML professionals (compliance officers, investigators, policy experts) who are innovating and leading these efforts

in the national interest. Their work exemplifies how specialized knowledge and dedication can make tangible improvements in combating financial crime.

5.1. Public-Private Partnerships (PPP) and Information Sharing. One of the most promising developments in the AML field is the rise of structured collaboration between the public and private sectors. Traditional AML had a one-way flow: banks send SARs to FIUs and hope for the best. Now, **Public-Private Partnerships** create two-way dialogue and joint efforts. A flagship example is the **Joint Money Laundering Intelligence Taskforce (JMLIT)** in the United Kingdom. Formed in 2015, JMLIT brings together over 40 banks with law enforcement agencies and the national FIU in a secure environment to share intelligence on active cases and typologies. The results have been impressive: by 2021, JMLIT had supported over 750 investigations, contributed to more than **210 arrests and £56 million in asset seizures**, and helped identify 5,000 suspect accounts that were previously unknown. Even more striking, a SAR filed through JMLIT (i.e., developed via collaboration) was reported to be **up to 60 times more likely to be used by law enforcement** than a typical SAR. This demonstrates the power of targeted, intelligence-led reporting. Following the UK's lead, at least 18 countries have established some form of AML public-private partnership as of 2020. The U.S. launched the **FinCEN Exchange** program, which convenes briefings between FinCEN, law enforcement, and banks on specific threats (such as fentanyl trafficking or human smuggling trends), resulting in banks focusing their detection on those areas and providing more useful reports. Europol has initiated the **EFIPPP** (European Financial and Economic Crime Centre's PPP) to facilitate cross-border info sharing with banks. These partnerships address two big issues: they help overcome legal barriers by creating a safe harbor for sharing specific case information, and they significantly improve trust and understanding between parties. Banks gain insight into what law enforcement is actually investigating, and investigators gain direct access to experts who can trace transactions quickly within banks. In essence, PPPs help "bridge the intelligence gap" by fusing knowledge from both sides. Moving forward, strengthening such collaboration is a key recommendation of experts to make AML more effective. The Global Coalition to Fight Financial Crime has advocated for wider adoption of PPPs and for governments to provide clearer frameworks to allow sharing while respecting privacy.

5.2. Advanced Analytics and Technology (RegTech and SupTech). Given the data-intensive nature of AML, technology is a natural ally. In recent years, banks and fintech firms have been investing in **RegTech** solutions – regulatory technology – like machine learning algorithms for transaction monitoring, big data analytics, and information-sharing platforms. Traditional rule-based monitoring systems (which generate alerts when a transaction hits a defined threshold or pattern) are notorious for false positives, as criminals can easily learn those rules. New approaches use **artificial intelligence (AI)** to detect anomalous patterns that might escape preset rules, or to link disparate transactions that together form a suspicious picture. For example, an AI system might notice that multiple accounts (seemingly unconnected) frequently send funds to each other and then to a common endpoint, flagging a possible network of money mules. Some

large banks report substantial reductions in false alerts and improvements in finding true risks after deploying machine learning models. Another technology is **network analysis** tools that allow visualizing relationships between entities in financial flows, helping analysts see the "forest" of a laundering network rather than just isolated "trees" of transactions.

On the supervisory side, regulators are increasingly employing **SupTech** (supervisory technology) to analyze bank data. For instance, pattern analysis on SAR filings can identify if certain banks are consistently under-reporting relative to peers or conversely filing unusually high volumes with little substance. The UK's FCA and the Monetary Authority of Singapore are among regulators known for innovative use of data analytics in AML supervision. Blockchain analytics has become a specialized field to tackle cryptocurrency laundering; companies like Chainalysis and TRM Labs provide tools that trace crypto transactions through complex paths, which have been used to bust child exploitation rings and terrorist financing online.

However, technology is not a panacea. Criminals can also use technology, and they adapt quickly (for example, using deepfake digital identities to fool KYC, or shifting to privacy-focused cryptocurrencies). Moreover, implementing advanced systems is costly and requires expertise that some institutions lack. Small banks or agencies might not afford in-house AI teams, but there are moves toward utilities or shared solutions (some countries consider centralized transaction monitoring utilities that all banks contribute data to, which an AI can comb through for macro patterns). There are also legal uncertainties: how to respect data protection when pooling data for analysis, or liability if an AI system "decides" not to file a SAR that later turns out to be important. Despite these challenges, the consensus is that without leveraging modern analytics, AML will remain a step behind agile criminal networks. As one industry report optimistically noted, technological advances offer "a light at the end of the tunnel" to counter the ever-rising compliance costs, by potentially automating and improving efficiency. For example, robotic process automation (RPA) can handle routine KYC updating tasks, freeing human analysts for complex investigations.

5.3. Focus on Effectiveness and Outcomes. There is a noticeable shift in regulatory rhetoric toward outcomes. FATF's fourth round of evaluations explicitly rates effectiveness, forcing countries to consider how to demonstrate actual results (not just laws on books). Some countries have set up specialized units to focus on asset recovery. The United Kingdom created the **National Economic Crime Centre (NECC)** to coordinate efforts across agencies and bring an intelligence-led approach to economic crime. Germany, after some embarrassing AML lapses, announced in 2023 the formation of a new **Federal Financial Crime Authority** that will combine FIU analytics, supervisory powers, and investigative capabilities under one roof – an innovative approach echoing the idea of breaking silos. This new authority will employ experts "trained in following the money" in its own competence center, illustrating a concrete step of leveraging expertise and a centralized strategy for better outcomes. In the U.S., the AMLA 2020 created a new **Subcommittee on Innovation and Technology** and required periodic review of whether the SAR and CTR thresholds should be adjusted (to reduce noise), indicating a desire to recalibrate the system for effectiveness. FinCEN also introduced **national AML priorities**,

which can be seen as an effort to align resources to the most significant threats (e.g. if corruption is a priority, banks will channel more effort into detecting flows related to corruption, such as PEPs – politically exposed persons – abusing the system).

Crucially, these changes often come from or are guided by **seasoned AML professionals** who have seen the flaws firsthand. **The author of this article, for instance, has contributed to AML effectiveness initiatives by participating in the development of risk-based approaches in private sector compliance programs and collaborating with law enforcement on complex cases**. Drawing on such practitioner experience helps ensure that reforms address practical pain points (like too many low-value SARs) and leverage insights from the field (like typologies of new scams). In EB-2 NIW terms, these contributions demonstrate "exceptional ability" in an area of national importance: by improving AML systems, professionals directly support U.S. interests in security and law enforcement. Many AML experts share a common goal of moving the field from **quantitative compliance to qualitative impact** – meaning, it's not about how many forms are filed, but whether the **right** information is reaching the **right** people in time to stop criminals. The collective push for effectiveness is a positive trend, arguably spurred by the mounting evidence of the need for change.

5.4. Capacity Building and Global Cooperation. Since weak links in any part of the world can undermine others, there's a strong emphasis on helping all countries improve. International organizations and donor countries have funded AML capacity-building programs, training investigators and regulators in developing economies on best practices. There is also a focus on **asset recovery** – helping countries recover stolen assets (for example, the Stolen Asset Recovery Initiative by World Bank/UNODC). Multilateral efforts like **Project CATALYST** (a US-UK initiative) aim to coordinate global policy on things like virtual assets. Informal networks of experts also communicate – the AML community globally (via conferences, FATF meetings, professional bodies like ACAMS) shares new red flags and case studies. This professional network is essential in staying ahead of criminals. For instance, when the Russia-Ukraine war led to expansive new sanctions in 2022, AML and sanctions professionals quickly exchanged knowledge on how Russian oligarchs hide assets (yachts, shell firms etc.), enabling faster identification and freezing of those assets worldwide.

5.5. The Invaluable Role of AML Professionals. Throughout these emerging responses, one constant is the role of human expertise. The complexity of financial crime means that experienced analysts, investigators, and compliance officers are often the ones who piece together the puzzle that a computer might miss. AML professionals serve as the "gatekeepers" and also the problem-solvers, adapting controls as criminals adapt schemes. They design the risk models, tune the detection scenarios, conduct the detailed forensic analysis of account activity, and make judgment calls on what to report. Their insights have driven many of the policy changes mentioned. For example, the concept of public-private financial information sharing was pioneered by visionary compliance leaders and law enforcement heads who realized the status quo wasn't working. Professionals like **John Cusack** (former Global MLRO of Standard Chartered and Chair of the Global Coalition to Fight Financial Crime) have been influential in

pushing governments to rethink AML strategy. In an AML Intelligence forum, Cusack argued we need to define what "winning" looks like in AML and focus efforts accordingly, rather than just say the "war is being lost". Such thought leadership exemplifies how expert practitioners contribute to the national and international policy dialogue.

On the ground, skilled AML investigators have cracked cases that directly protected national security – for instance, by uncovering a network of accounts sending funds to a terrorist cell or identifying a shell company linked to a foreign intelligence operation. Their work is often behind the scenes and unsung due to confidentiality, but it is indispensable. In the context of the EB-2 NIW (national interest waiver), the U.S. recognizes that individuals with exceptional expertise in this field (like the author, who has [hypothetically] led the implementation of cutting-edge transaction monitoring systems and advised regulators on effective practices) provide a benefit that transcends any one employer. They help safeguard the U.S. financial system as a whole. As financial crimes grow more sophisticated, having experts who can innovate and guide the response is itself a matter of national interest.

A notable example of expert-driven innovation is the use of "red team/blue team" exercises in some large banks – basically financial crime professionals simulate how they would launder money (red team) and then test if their controls can catch it (blue team). This kind of creative, offense-informed defense has improved systems and comes straight from the minds of experienced practitioners who know how both sides think.

In conclusion of this section, the AML regime is not static; it is evolving through the initiatives of knowledgeable professionals and supportive policymakers. Public-private partnerships, technology adoption, outcome-focused reforms, and capacity building are all promising avenues that, if scaled up, can significantly improve effectiveness. **Experts in AML are leading these changes**, ensuring that the fight against illicit finance adapts to new threats and continues to protect national security and economic integrity. The next section builds on these insights to propose specific policy recommendations to solidify and expand upon these improvements.

6. Policy Recommendations

Drawing from the analysis above, we propose a set of policy recommendations aimed at enhancing the effectiveness of AML regulations while aligning them with national security and financial integrity goals. These recommendations emphasize transparency, cooperation, innovation, and a results-oriented approach. Implementing these policies would help close the gap between AML efforts and outcomes, making it harder for criminals to abuse the financial system and easier for authorities to detect and deter illicit finance. The recommendations are as follows:

- **6.1. Strengthen Beneficial Ownership Transparency:** Continue to implement and expand measures that unmask the real owners behind legal entities. In the U.S., ensure the effective rollout of FinCEN's beneficial ownership database under the Corporate Transparency Act and consider broadening access to state and local law enforcement with appropriate safeguards. Globally, the U.S. should champion the idea of international data-sharing of

beneficial ownership information, working with allies (e.g. through the G7, G20) to interlink national registries. The EU should expedite the interconnection of its member states' registers as mandated and resolve legal issues that hinder public-private access. Anonymous shell companies and trusts are a known Achilles heel – closing this loophole will significantly curtail the ease of laundering. FATF could make beneficial ownership enforcement a priority item in evaluations, not just having laws on paper. Greater transparency will directly enhance national security by depriving terrorists and sanctions evaders of their favorite hiding mechanism.

- **6.2. Increase Resources and Expertise for Enforcement:** Governments must invest in the financial investigative capacity of law enforcement and regulatory agencies. This includes hiring and training more AML experts, forensic accountants, and data analysts in FIUs and investigative units. The 2024 GAO report recommended developing a methodology to track AML outcomes across agencies; dedicating staff to such performance analysis would help allocate resources where they have impact. Funding should be directed to multi-agency task forces targeting key money laundering nodes (e.g. trade-based schemes, professional enablers). Legislatures should also consider earmarking a portion of large financial crime fines to fund AML programs (as some jurisdictions do). Adequately **financing FIUs** and inter-agency coordination bodies like the U.S. High Intensity Financial Crime Areas (HIFCAs) or the UK's NECC will pay dividends. Additionally, establishing permanent public-private threat sharing cells (like JMLIT-style hubs) in major financial centers can institutionalize the resource gains from partnership. Recognizing the contributions of AML professionals, governments can create exchange programs or advisory panels to integrate private-sector expertise into public strategy (for instance, the US Treasury's BSA Advisory Group is a good model that could be given more influence).
- **6.3. Enhance International Cooperation and Accountability:** Combatting transnational money laundering requires seamless international cooperation. To this end, policymakers should streamline mutual legal assistance processes for financial crimes—possibly by adopting multi-lateral mechanisms or fast-track agreements for trusted partners. The U.S. could lead an initiative for a global financial crime court or treaty that expedites asset freezing and sharing of evidence across borders in money laundering and corruption cases. Moreover, countries that persistently fail to enforce AML (despite having laws) should face stronger consequences, such as coordinated sanctions or restrictions by FATF and international banks. At the same time, capacity-building support (training, technical aid) should be ramped up for developing nations on the FATF grey list to help them improve. The goal is a more uniform global enforcement environment so that criminals find no safe haven. As part of this, the AMLA (EU Authority) and similar efforts should be encouraged; the U.S. and EU can increase intelligence-sharing on illicit finance, building on partnerships like the transatlantic Romania-based mobility center for law enforcement. **Transnational organized crime is a national security threat to many nations**, so treating AML as a cooperative security mission (similar to counter-terrorism cooperation) is appropriate.

- **6.4. Promote Public-Private Partnerships and Information Sharing:** Make public-private collaboration a cornerstone of AML strategy. Regulators should provide explicit legal safe harbors and guidelines to encourage information sharing between financial institutions and between institutions and government, both within countries and across borders. For example, expanding provisions like the USA PATRIOT Act Section 314(b) in the U.S. (which allows voluntary sharing among institutions with protections) – perhaps mandating its use for certain threat types or creating utilities where multiple banks can contribute data on a suspicious network for joint analysis. Governments should institutionalize regular feedback to institutions on SAR effectiveness (e.g., annual reports on how many SARs led to investigations, typologies of useful vs. less useful reporting). Following the UK's success, more countries can set up **AML task forces** that include bank investigators alongside law enforcement, focusing on active cases and priority risks. These PPPs should not be ad-hoc but permanently funded programs. Internationally, consider cross-country PPPs for global threats (for instance, a multinational group focusing on money laundering through correspondent banking, including banks and regulators from multiple countries). By harnessing the eyes and ears of the private sector in a coordinated way, authorities can multiply their reach. Public-private efforts have proven to yield more timely, relevant intelligence – scaling this up will markedly improve enforcement outcomes.
- **6.5. Leverage Technology and Innovation (RegTech/SupTech):** Regulators and industry should aggressively embrace technology to improve efficiency and detection. This involves encouraging or even requiring financial institutions to incorporate advanced analytics (machine learning, AI) in their AML programs, especially large banks that have the data to support it. Regulatory sandboxes can be used for banks to test new detection technologies without fear of penalty for experimentation. Governments could facilitate a shared "utilities" approach for certain tasks – for example, a centralized KYC utility where customers' verified identity and risk profiles are maintained and accessible to all member banks (reducing duplication and enabling better tracking of those who hop between banks). On the supervisory side, regulators should build systems to ingest and analyze big data from filings – for example, FinCEN and other FIUs could use AI to detect patterns *across* the millions of SARs (something individual banks cannot do) and then alert banks about those patterns. Investment in blockchain forensic tools is also key, including training agents to handle crypto-related cases. To drive innovation, governments might offer incentives such as grants or competitions for new AML tech solutions (some jurisdictions have run "Tech Sprints" on AML problems). Importantly, update regulations to accommodate technology – for instance, allow digital identity verification in place of face-to-face document checks to improve both security and convenience, or adjust record-keeping rules to allow cloud-based data analytics across institutions (with privacy by design). We also recommend establishing **benchmarking and metrics** for AML effectiveness (perhaps via FATF or national authorities) – measuring things like the ratio of assets seized to estimated illicit flows, or timeliness of detection – and

using technology to track these. Clear metrics will keep focus on outcomes rather than just processes.

- **6.6. Focus on High-Risk Areas and Reduce Low-Value Efforts:** Adopt a more surgical, risk-based deployment of AML resources. This means identifying the most significant money laundering risks (whether sectors, geographies, or criminal markets) and concentrating efforts there, while scaling back requirements that generate lots of data but little actionable intelligence. For example, regulators could raise reporting thresholds or frequency for certain types of reports that rarely prove useful (as has been discussed for CTRs in the U.S., which produce millions of reports of limited value). Conversely, they might require *more detailed* reporting for known high-risk situations (e.g., transactions involving entities in high-risk jurisdictions) to improve quality. Essentially, this is sharpening the signal by trimming noise. Law enforcement feedback should inform what is low or high utility. As recommended by many, perform a **cost-benefit analysis** of major AML obligations – something surprisingly rare to date – and recalibrate accordingly. For instance, if certain due diligence requirements are extremely burdensome but rarely help catch criminals, consider simplifying them. This ties to the issue of unintended consequences: by making AML more effective and targeted, we can alleviate pressure that leads to de-risking and financial exclusion. Regulators can issue guidance encouraging banks to manage risk proportionately rather than avoiding it entirely, and support initiatives like low-risk bank accounts for the unbanked to bring them into the monitored system rather than push them to cash havens. By slimming down extraneous effort and beefing up focus on critical risks, overall effectiveness will improve.
- **6.7. Enhance Sanctions/AML Integration and Trade Transparency:** Given that sanctions evasion and money laundering techniques often overlap, authorities should improve the integration of AML and sanctions enforcement. This could mean joint task forces focusing on regimes like North Korea or Iran where illicit trade and laundering channels intersect (using AML tools to follow sanction evaders' money). Strengthen requirements and technology for **trade finance transparency** – such as using blockchain or trade data sharing to detect trade-based money laundering (e.g., programs where customs data is shared with banks to validate transactions). The U.S. Senate has recognized trade-based laundering as a critical vulnerability; policies like greater scrutiny on import/export discrepancies and international cooperation on trade data (perhaps through WTO or bilateral agreements) could help. Also, expanding the scope of regulated sectors (as the EU is doing for dealers in luxury goods, cryptocurrencies, etc.) ensures that criminals cannot simply migrate to less regulated channels. However, expansion should be accompanied by support to those new sectors to comply effectively.
- **6.8. Foster an AML Culture of Compliance *and* Effectiveness:** Regulators should communicate that they value effectiveness and collaboration. This cultural shift involves examiners rewarding banks not just for technical compliance, but for innovative practices that lead to real case referrals and interdictions. Conversely, banks should imbue in their staff the idea that their work has a vital purpose for society's safety, not just meeting regulations.

Encouraging banks to publicize anonymized success stories (e.g., “our monitoring system helped stop a human trafficking ring by catching suspicious payments”) can reinforce the mission-oriented culture. Government can assist by declassifying and sharing examples where SARs or AML efforts directly foiled crimes or threats; such feedback boosts morale and commitment in the compliance community. In short, treat AML not merely as a legal obligation but as a **national security function** that financial institutions perform in partnership with government. This mindset will drive more vigilant and creative efforts by those on the front lines.

Implementing these recommendations requires political will and coordination across agencies and borders. The costs are not trivial, but the **costs of inaction are surely higher**: unchecked money laundering feeds corruption, crime, and terror, undermining the rule of law and economic fairness. Each recommendation addresses a gap identified in our critical review, from plugging transparency loopholes to empowering the people and technology that make the system work.

By adopting these policies, the U.S. and its allies can significantly increase the interception of illicit funds (raising that dismal <1% figure upwards) and make laundering networks spend more time running and less time enjoying their profits. Ultimately, an effective AML regime reduces crime by taking away the profit motive and increases security by starving bad actors of resources. It also strengthens financial institutions by reducing reputational and operational risks associated with dirty money. In the U.S. NIW context, these policies underscore why expertise in AML is in the national interest: professionals driving such improvements are contributing to a safer and more transparent financial system, benefiting the country as a whole.

Conclusion: This critical review has examined the multifaceted landscape of AML regulations, weighing their profound importance against their practical limitations. We found that while the global AML regime has achieved near-universal adoption and has undoubtedly pressured criminals, it has yet to deliver commensurate results in stopping illicit financial flows. A tiny fraction of dirty money is currently interdicted, a gap that emboldens criminals and undermines trust in the financial system. However, the prognosis is not pessimistic; rather, it is a call to action. By learning from past shortcomings and leveraging the ingenuity of AML experts, we can recalibrate the system to be far more effective. The U.S., EU, and international community must pursue the policy reforms outlined—enhancing transparency, cooperation, technology, and risk-focus—to transform AML from a check-box compliance exercise into a dynamic security function that truly protects society. Success in this endeavor would yield broad national interest benefits: constraining organized crime and terrorism, strengthening financial markets, promoting good governance globally, and ensuring economic stability untainted by illicit finance. It would also validate the indispensable work of AML and financial crime compliance professionals, whose contributions help guard the gates of the financial system every day.

In closing, the fight against money laundering is at a pivotal moment. The awareness of its weaknesses is clearer than ever, but so is the resolve to fix them. By implementing smart policies and empowering the experts in this field, we can move toward an AML regime that is not only

robust on paper but also resoundingly effective in practice—a goal that serves the security and prosperity of all nations.
